(57) Abstract :

The present disclosure relates to a personal tracking system and method for remote monitoring of objects. In an embodiment, a personal tracking system (100) for remote monitoring of objects is disclosed. The system for personal tracking system for remote monitoring of objects comprises a plurality of sensors (102) configured to detect a movement of an object and a direction of the movement of the object. Further, the system comprises a mounting device (104) configured to strap the plurality of sensors to the object. Further, the system comprises a transceiver unit (106), operatively coupled to the plurality of sensors, and configured to display an information transmitted by the plurality of sensors to a user. Furthermore, the system comprises a processor (108), operatively coupled with the plurality of sensors, and configured to transmit the information received from the plurality of sensors to the transceiver unit.
